# Chapter 1: The Dawn of Programmable Objects

## From Artifacts to Gizmos: A Brief History of Shaped Things

The history of shaped things is vast and varied, stretching back to the earliest days of human civilization. From the simple tools and weapons of our ancestors to the complex machines and devices of today, shaped things have played a vital role in our development as a species.

In the beginning, shaped things were made by hand, using whatever materials were available. Rocks, bones, and wood were common materials, and tools such as hammers, axes, and knives were used to shape them into useful objects. These early artifacts were essential for survival, helping humans to hunt, gather food, and build shelter.

As civilizations developed, so too did the tools and techniques used to shape things. Metals such as copper, bronze, and iron were discovered and used to create more durable and sophisticated objects. The wheel was invented, revolutionizing transportation and warfare. And the development of writing allowed for the accumulation and dissemination of knowledge, which further accelerated the pace of technological progress.

The Industrial Revolution brought about a new era of mass production, which made it possible to produce shaped things more quickly and cheaply than ever before. This led to a proliferation of new products and technologies, from steam engines and railroads to electric lights and automobiles.

In the 20th century, the development of electronics and computers ushered in a new era of programmable objects. These objects, also known as cyber-physical systems, are able to sense, communicate, and respond to their environment. They are the foundation of the

modern world, and they are poised to revolutionize industries ranging from healthcare and education to manufacturing and transportation.

Today, we stand on the cusp of a new technological revolution, one that will see programmable objects become even more ubiquitous and sophisticated. These objects will be able to learn from their experiences, adapt to changing conditions, and even communicate with each other. They will transform the way we live, work, and interact with the world around us.

## The Rise of User-Alterable Objects

From the earliest days of human history, we have been creating objects to help us survive and thrive. These objects, from simple tools to complex machines, have been shaped by our needs and desires. In recent years, we have seen the rise of a new type of object: the user-alterable object.

User-alterable objects are objects that can be modified by the user to suit their individual needs and preferences. This can be done through a variety of means, such as changing the object's appearance, functionality, or behavior. User-alterable objects are often powered by embedded computers, which give them the ability to sense, communicate, and respond to their environment.

The rise of user-alterable objects is being driven by a number of factors, including the increasing availability of powerful and affordable embedded computers, the growing popularity of open source software and hardware, and the maker movement. As a result, we are seeing a proliferation of user-alterable objects in a wide range of applications, from consumer electronics to industrial machinery.

One of the most significant developments in the field of user-alterable objects is the emergence of 3D printing. 3D printing allows users to create custom objects from a variety of materials. This technology has the potential to revolutionize the way we design and manufacture objects, making it possible to create objects that are perfectly tailored to our individual needs.

The rise of user-alterable objects is also having a significant impact on the way we think about ownership and consumption. In the past, we were limited to buying objects that were mass-produced and

designed for the average consumer. Today, we have the ability to create objects that are unique and personal to us. This is leading to a shift away from mass consumption and towards a more sustainable and personalized approach to consumption.

The rise of user-alterable objects is a major trend that is having a profound impact on our lives. These objects are transforming the way we interact with the world around us, and they are poised to play an even greater role in our future.

# Chapter 1: The Dawn of Programmable Objects

## The Convergence of Physical and Digital Worlds

The convergence of the physical and digital worlds is one of the most significant trends shaping our world today. Programmable objects are at the forefront of this convergence, blurring the lines between the real and the virtual.

In the past, physical objects and digital information existed in separate realms. Physical objects were tangible and could be manipulated in the real world, while digital information was intangible and could only be accessed through computers and other electronic devices. However, the advent of programmable objects is changing all that.

Programmable objects are physical objects that can be programmed to sense, communicate, and respond to their environment. This allows them to bridge the gap between the physical and digital worlds, bringing digital information into the real world and allowing us to interact with it in new and innovative ways.

For example, consider a programmable thermostat. A traditional thermostat is a physical object that can be used to control the temperature of a room. However, a programmable thermostat is much more than that. It can be programmed to learn your heating and cooling preferences and adjust the temperature accordingly. It can also be controlled remotely using a smartphone or tablet, allowing you to adjust the temperature from anywhere.

This is just one example of how programmable objects are converging the physical and digital worlds. As these objects become more sophisticated and affordable, we

can expect to see them play an even greater role in our lives.

In the future, programmable objects could be used to create smart homes that can adjust to our needs and preferences, self-driving cars that can navigate our roads without human input, and wearable devices that can monitor our health and provide us with real-time feedback. The possibilities are endless.

The convergence of the physical and digital worlds is a powerful trend that is changing the way we live, work, and interact with the world around us. Programmable objects are at the heart of this convergence, and they are poised to revolutionize our world in profound ways.
